Narrowed Questions

1. **How has the time Americans spend socializing changed since 2003?**
   The case. Daily socializing for 15–24-year-olds fell from 59 to 36 minutes, down 39%.
2. **Which age groups lost the most?**
   The case, plus the distant clocks. Young adults lost the most, about 23 minutes a day. Every other age group lost 6 to 12.
3. **Was it work or screens that took the time?**
   The suspects. Neither: work fell 18 minutes a day and TV fell 34. Young people got time back and still socialized less.
4. **What activities grew as socializing shrank?**
   The suspects. Sleep and personal care (+39 min), other leisure such as games, computers and reading (+29), and chores (+18).
5. **When did socializing disappear: weekdays or weekends?**
   Clue 1. Mostly weekdays: 50 → 28 minutes, while weekends held up better at 80 → 54.
6. **Are people spending more of their day alone?**
   Clue 2 and the scale. Yes. For ages 20–24, waking time alone rose from 4h13m to 5h37m (2010–11 to 2024–25), and time with others fell by nearly two hours. Across all ages, time with friends halved.
7. **How does the picture differ for parents and non-parents?**
   Explore your day. People without kids at home lost about twice as much social time (−13 min/day) as parents (−6).
8. **How does your own day compare?**
   Explore your day. Readers choose their age group, parent status and day type to see their own then-and-now.

Closing though: what happens to connection if technology like AI changes how we spend our time? ATUS has no data on AI, so we raise this only as a short reflection at the end.
